

mesuINSERT

**Test body addition and collection station
for metal separators**

Safe and process-reliable

The system enables a central task of the test bodies in accordance with the statutes of the IFS, BRC and others. The construction is designed according to hygiene standards and avoids the creation of dirt nests. The optimised structure means that throughput performance is not significantly reduced.

Flexible adaptation to the application

The compact design makes it easy to retrofit many existing systems in the QUICKTRON series. In addition to a large number of available diameters, the system is safe for use in the ATEX sector.
